

SD605™

DUST ABATEMENT

PATENTED DIRT-DUST PARTICLE LOCK TECHNOLOGY®

SD605 is the ideal choice for dust from concrete products manufacturing, construction dust control, roadway dust control, logging road dust control, quarry and mining, agricultural operations, erosion control, soil stabilization, and road bed soil compaction.

SD605 is an economical long lasting dust control product. It can be applied undiluted or mixed with water.

SD605 when applied develops a harden surface. This is extremely important where there is a light powdery dust problem. It forms a rigid non drying surface crust by attracting and combining the dust particles. Surface traffic compresses the dust and product mix to form a denser matrix. This provides long term control. Controlling dust with water trucks alone requires multiple trips to maintain moisture. This type of control is costly and time consuming. Using **SD605™** will save money by reducing labor and fuel cost. After the first application of **SD605™**, occasional maintenance application is required to maintain proper product level in the dust bed.

SD605™ particle lock technology allows for rapid road bed compaction for roadway construction. Construction dust pollution can result in fines and costly work stoppages. **SD605™** is a low cost insurance against dust.

SD605™ is available in:

- 5 gallon jugs
- 55 gallon drums
- 275 gallon totes.
